EVIS EXERA PLEURAVIDEOSCOPE

LTF-160

Medical Thoracoscopy under Local Anesthesia is Now Easier Than Ever
With its slim design and wide channel, the autoclavable LTF-160 from OLYMPUS is today’s choice for medical thoracoscopy.

With the incidence of respiratory disease on the rise worldwide, thorascopes are becoming an indispensable part of every physician’s toolkit. The OLYMPUS LTF-160 has been specially designed to simplify and streamline medical thoracoscopy under local anesthesia with a slim, flexible design that allows you to quickly perform procedures. Unlike rigid scopes, the LTF-160 requires only a single puncture. And unlike fiberscopes, the LTF-160 makes it easy for you to keep your orientation inside the pleural cavity. This handy scope is also autoclavable so you’ll be able to perform percutaneous procedures with confidence.

**Outstanding image quality**

With the LTF-160, you’ll always benefit from OLYMPUS signature sharpness and clarity when viewing the inside of the pleural cavity. Images are picked up by a high-resolution CCID in the scope tip so they can be displayed on your monitor in a big easy-to-see screen that’s larger than the most screen used with rigid scope images.

**EVIS EXERA 160 Series and downward compatibility**

While the LTF-160 has been especially designed to capitalize on the advanced capabilities of the EVIS EXERA 160 Series system, you can still use this scope with the EVIS EXERA 160 Series, as well as with the earlier EVIS 100 and 140 Series, when connected to the EVIS EXERA 160 Series DU-C150 processor. The CV-150’s scope ID function stores individual scope information and displays it on the monitor.

**Versatile insertion tube design**

To facilitate intercostal insertion under local anesthesia, the insertion tube of the LTF-160 measures only 7 mm in diameter, yet that slim design still offers a powerful range of capabilities including 140° upward/120° downward two-way angulation capability and a 2.8 mm diameter channel. This makes it possible to perform a sequence of procedures with a single scope — including observing and biopsy the parenchyma, and a single puncture in the patient’s chest is all you need to perform all these procedures.

**Control section with superb maneuverability**

The control section of the LTF-160 features the same innovative design as the EVIS EXERA BF-160 Series bronchoscope scopes, fitting snugly in the palm of your hand, the ergonomic control section offers you the kind of scope-handling that has made our BF-160 Series scopes so popular. The control section also features four remote switches that let you operate connected ancillary equipment without taking your hand off the control.

**Long universal cord**

To maintain the necessary clear area around the LTF-160 is provided with a long 2.5-m universal cord for connection to the processor.

**Compatible with electrosurgical and laser treatments**

The LTF-160 can be used in conjunction with various electrosurgical or laser procedures.

**Auto clave design**

For easy, quick, and cost-effective sterilization, the LTF-160 is autoclavable. To protect electrical connections, a dedicated waterproof cap is provided. Since this technique makes inserting the scope particularly easy, autoclavability ensures maximum reliability.

Standard Accessories

MAJ-1058 Flexible Trocar (8-mm inner diameter)
Designed for use with the LTF-160, the MAJ-1058 is made of advanced materials that provide just the right combination of flexibility and stiffness. The LTF-160's insertion tube slides in the trocar's lumen so smoothly that it even reduces stimulation to the intercostals. The MAJ-1058 also protects the bending section of the scope. A sterile, disposable design adds convenience.

FB-55CR-1 Dedicated Biopsy Forceps
The V-toothed alligator jaws of the FB-55CR-1 allow collection of a large tissue specimen. A needle between the jaws prevents the forceps from slipping from the target site while the exclusive Swing Jaw mechanism facilitates accurate targeting. As a result, the FB-55CR-1 is ideal for accessing a biopsy target from an oblique direction.

Optional Accessories

OLYMPUS’ versatile lineup of Endo-Therapy accessories offer a wide variety of choices to meet your requirements.

PW-6C-1 Spray Catheter
Used when spraying dye or other solution inside the pleural cavity. The solution is turned into very fine droplets.

CD-6C-1 Electrosurgical Coagulator
Offers outstanding hemostatic performance.
